Mvc C# .csv file data get in sql table

1. Create a CSV file for students with the columns: RollNumber, Name, MobileNumber, City, Address, Email, and Pincode
2. Create a C# application to read data from the CSV file.
3. After reading all the data, save this information into an SQL table.
4. If any record does not have an email, do not save that record in the SQL table.
5. If the mobile number does not have the prefix +91, add it before the number.
6. If the pincode has more than 6 characters, do not add that record to the table.
7. If the RollNumber already exists in the SQL table, update the other information for that student.
